LAGON® 480E has become one of Canada's leading insecticides due to its reliable performance under a wide range of environmental conditions, the wide variety of crops it can be used in and the broad-spectrum of insects controlled. When growers have tough to control insects in their crops, they can count on **LAGON** to control the problem every time.

Product Benefits:

- Pests such as aphids, leafhoppers, tarnished plant bugs, lygus bugs, bean beetles and spider mites suck juices and nutrients out of the plant reducing plant/seed development. Bean beetles feed on pods and leaves, **LAGON** controls them all!
- Provides local systemic, contact and stomach activity. The product is absorbed and translocated by the leaf tissue to the insect's location. **LAGON** penetrates the leaf and gets to the underside of leaves to kill aphids, with up to 7 days control.
- Active under a wide range of application temperatures, it works well during hot periods when aphids and mites thrive.
- Part of a sound resistance management strategy – a group 1B insecticide/acaricide.
- Adding **LI 700®** non-ionic penetrating surfactant to the spray tank benefits the control. Lowering spray water pH to 5-6 is optimal and costs only pennies per acre.
- **LI 700** has unique penetrating properties which improves the systemic action of the **LAGON** to optimize efficacy.
